Office Action Summary

Application No.

09/982,372

Applicant(s)

DUTTA, AMIT

Examiner

Jason T. Whipkey

Art Unit

2612

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☐ Responsive to communication(s) filed on ____.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-23 is/are pending in the application.
- 4a) Of the above claim(s) ____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) ____ is/are allowed.
- 6) ☒ Claim(s) 1-23 is/are rejected.
- 7) ☐ Claim(s) ____ is/are objected to.
- 8) ☐ Claim(s) ____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 09 December 2002 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. ____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892) ✓
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08) ✓
Paper No(s)/Mail Date 10/18/01 & 2/11/04. ✓
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date. ____.
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: ____.

DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

2. Claims 1-5, 7-10, 14-17, and 20-22 are rejected under 35 U.S.C. 102(e) as being anticipated by Chen (U.S. Patent Application Publication No. 2001/0010546).

Regarding **claim 1**, Chen discloses a handheld device (VR camera 12 in Figure 1; see paragraph 34) for taking an image of an object, comprising:

a camera module (comprised of optic 15 and image acquisition unit 17) capable of focusing on and generating an electronic image signal corresponding to an image of the object (see paragraph 21);

a motion sensor (orientation/position sensor 21) for sensing movement of said camera module and for generating a movement signal indicative of the movement of said camera module (see paragraphs 25-26); and

a transmitting means (the connections from image acquisition unit 17 and orientation/position sensor 21 to processor 19; see Figure 1) for transmitting the

electronic image signal and the movement signal to a processing engine (processor 19).

Regarding **claim 2**, Chen discloses:

a processing engine (processor 19) receiving the electronic image signal and the movement signal from the transmitting means (see Figure 1), and for processing the electronic image signal in response to the movement signal to correct the image signal for movement of said camera module (angular errors such as the ones in the discrete images 35 shown in Figure 2 are compensated for; see paragraph 34), and for combining a plurality of corrected image signals into an electronic image output signal corresponding to a single image of the object (resulting in panoramic image 41; see paragraph 35).

Regarding **claims 3, 4, and 7**, Chen teaches in paragraph 25 that orientation/position sensor 21 detects a change in position relative to an arbitrary starting point by measuring position in three dimensions.

Regarding **claim 5**, Chen teaches in paragraph 25 that accelerometers are used to detect movement.

Regarding **claim 8**, Chen teaches in paragraph 35 that memory 25 stores a plurality of electronic image signals corresponding to the plurality of images of the object.

Regarding **claim 9**, Chen teaches in paragraphs 38-39 that the processing engine is capable of combining a plurality of corrected image signals (composite image 59 in Figure 3) corresponding to a plurality of images taken of different portions of the object.

Regarding **claim 10**, Chen teaches in paragraphs 38 and 40 that the processing engine is capable of combining a plurality of corrected image signals corresponding to a plurality of

Art Unit: 2612

images taken of the object to result in a signal capable of producing an image of a higher quality than any of the single images.

Regarding **claim 14**, Chen discloses a method for obtaining an image of an object with a handheld device (VR camera 12 in Figure 1; see paragraph 34) containing a camera module (comprised of optic 15 and image acquisition unit 17) and a motion sensor (orientation/position sensor 21), said method comprising:

taking a plurality of images (see paragraph 30) of the object with the camera module to generate an electronic image signal corresponding to each of the plurality of images taken (see paragraph 21);

storing the plurality of electronic image signals (in memory 25; see paragraph 35);

sensing movement of the camera module (using orientation/position sensor 21) between the taking with the camera module of the plurality of images of the object (see paragraphs 25-26);

generating a plurality of movement signals which are indicative of sensed movement of the camera module (see *id.*);

processing (via processor 19) each of the plurality of electronic image signals in response to the movement signals to correct for movement of the camera module to generate a plurality of corrected electronic image signals (see paragraph 34); and

combining the plurality of corrected electronic image signals into an electronic output signal corresponding to a single image of the object (see paragraph 35).

Art Unit: 2612

Regarding **claims 15 and 16**, Chen teaches in paragraph 25 that orientation/position sensor 21 detects a change in position relative to an arbitrary starting point by measuring position in three dimensions.

Regarding **claim 17**, as described in the rejection of claim 14, Chen's camera performs the storing, processing, and combining internally.

Regarding **claim 20**, Chen teaches in paragraphs 38-39 that the camera combines a plurality of corrected image signals (composite image 59 in Figure 3) corresponding to a plurality of images taken of different portions of the object.

Regarding **claim 21**, Chen teaches in paragraphs 38 and 40 that the processor is capable of combining a plurality of corrected image signals corresponding to a plurality of images taken of the object to result in a signal capable of producing an image of a higher quality than any of the single images.

Regarding **claim 22**, Chen discloses displaying on a display (unlabeled) of the handheld device an image in response to the electronic image output signal (see paragraph 40).

Claim Rejections - 35 USC § 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Art Unit: 2612

4. Claim 6 is rejected under 35 U.S.C. 103(a) as being unpatentable over Chen in view of Perlmutter (U.S. Patent Application Publication No. 2002/0123386).

Claim 6 may be treated like claim 4. While Chen does teach that the position of the camera in a three-dimensional space is detected “by including in the O/P sensor 21 accelerometers *or other devices*” (emphasis added), Chen is silent with regard to specifically including a gyroscope.

Perlmutter discloses a handheld device including an internal motion sensor. In paragraph 53, Perlmutter teaches that an advantage of including a gyroscope is that the change in direction and angle of the device can be measured, as opposed to just the change of speed measured by an accelerometer. Therefore, including both would provide more accurate information. For this reason, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have Chen’s camera include a gyroscope, as described by Perlmutter.

5. Claims 11-13, 18, 19, and 23 are rejected under 35 U.S.C. 103(a) as being unpatentable over Chen in view of Thomas (U.S. Patent No. 6,781,623).

Claims 11 and 18 may be treated like claims 2 and 17, respectively. However, Chen is silent with regard to the handheld device being a mobile phone.

Thomas discloses a wireless video phone that accounts for camera movement during image capture (see column 1, lines 11-49). An advantage of including a camera in a video phone is that images may be easily transmitted to a remote viewer using a piece of equipment commonly carried. For this reason, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have Chen’s camera incorporated into a mobile phone.

Art Unit: 2612

Claim 12 may be treated like claim 1. While Chen discloses combining a plurality of corrected image signals into an electronic image output signal corresponding to a single image of the object (see paragraphs 38-39), he is silent with regard to performing the processing in a remotely located processing engine.

Thomas discloses a camera, including:

a processing engine (base station 50; see Figure 9) located remotely from the handheld device (see column 7, line 55), said processing engine receiving the electronic image signal (see column 7, lines 40-43) and the movement signal (see column 7, lines 43-48, and column 4, lines 43-45) from the transmitting means and for processing the electronic image signal in response to the movement signal to correct the image signal for movement of said camera module (see column 7, lines 48-53).

As stated in column 7, lines 53-60, an advantage of performing processing remotely from the handheld device is that sophisticated image processing techniques can be created on a larger computer instead of adding processing power to every camera/phone. For this reason, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have Chen's camera perform processing remotely, as described by Thomas.

Regarding **claim 13**, Chen is silent with regard to the handheld device being a mobile phone.

Thomas discloses a wireless video phone that accounts for camera movement during image capture (see column 1, lines 11-49). An advantage of including a camera in a video phone is that images may be easily transmitted to a remote viewer using a piece of equipment

Art Unit: 2612

commonly carried. For this reason, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have Chen's camera incorporated into a mobile phone.

Claim 19 may be treated like claim 1. While Chen discloses combining a plurality of corrected image signals into a single image (see paragraphs 38-39), he is silent with regard to performing the processing in a remotely located processor.

Thomas discloses a camera, wherein storing the plurality of electronic image signals (storage inherently occurs when processing multiple frames together) and processing each of the plurality of electronic image signals is performed by a processor remote from the handheld device (see column 7, line 55).

As stated in column 7, lines 53-60, an advantage of performing processing remotely from the handheld device is that sophisticated image processing techniques can be created on a larger computer instead of adding processing power to every camera/phone. For this reason, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have Chen's camera perform processing remotely, as described by Thomas.

Claim 23 may be treated like claim 14. However, Chen is silent with regard to transmitting the image output signal to a remote display.

Thomas discloses a wireless video phone that accounts for camera movement during image capture. Images are captured and transmitted to a remote display (see column 1, lines 11-49). An advantage of having a camera transmit images to a remote display is that information about a subject may be shared with a remote viewer. For this reason, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have Chen's camera transmit images to another device.

Art Unit: 2612

Conclusion

6. The prior art made of record and not relied upon is considered pertinent to Applicant's disclosure.

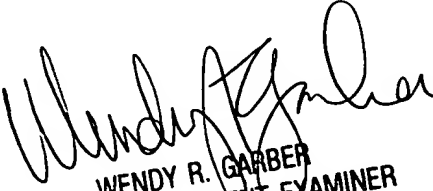

7. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jason Whipkey, whose telephone number is (571) 272-7321. The examiner can normally be reached Monday through Friday from 9:00 A.M. to 5:30 P.M. eastern daylight time.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Wendy Garber, can be reached at (571) 272-7308. The fax phone number for the organization where this application is assigned is (703) 872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
